

Logic Programming

Course Outline

*Department of Artificial Intelligence
School of Computer Science
Technical University of Madrid
28660-Boadilla del Monte, Madrid, SPAIN*

The following people have contributed to this course material:

Manuel Hermenegildo (editor), Francisco Bueno, Manuel Carro, Pedro López, and Daniel Cabeza, Technical University of Madrid, Spain; María José García de la Banda, Monash University, Australia; David H. D. Warren, University of Bristol, U.K.; Ulrich Neumerkel, Technical University of Vienna, Austria; Michael Codish, Ben Gurion University, Israel

Course Outline

- Introduction.
- Pure logic (relational) programming.
- The Prolog Language. Programming in Prolog.
- Efficient Prolog programming.
- Combining Logic Programming, Functional Programming, Higher Order, Objects.
- The Ciao Programming System.
- Review of first order predicate logic and resolution. Fundamental results.
- Semantics of logic programs.
- Other topics (if time permits).
 - ◇ Implementation of logic languages and advanced compilation.
 - ◇ Parallelism, concurrency.
 - ◇ Other LP/CLP languages.
